

SIEGE INTERNATIONAL

Defend your Data

Founded in Denver, CO in 2014, and a veteran owned small business, Siege International provides cybersecurity services to help organizations protect their business-critical information systems and data. We help secure the networks, websites, and operations of private businesses, retailers, banks and credit unions, airports, healthcare providers, energy suppliers, and state and local governments internationally. Our founders and consultants have specialized in cybersecurity related disciplines their entire professional careers, and are continuously trained and certified to exceed the needs of our clients.

➤ Security Audit

Whether your organization has a compliance requirement to meet (HIPAA, FFIEC, NCUA, PCI), or you're looking to align with a cybersecurity best practice framework (SANS Top 20, NIST, ISO 27001), Siege International offers an audit service to meet your objectives.

➤ Penetration Testing

Can your organization detect and defend against a targeted cyber-attack? A Siege International penetration test engagement will answer that question, and provide key insights into vulnerabilities which could lead to a compromise of your critical data.

➤ Incident Response

Siege International routinely supports organizations through cybersecurity incidents such as website breach, network breach, malware outbreaks, unauthorized access, privileged user terminations, Advanced Persistent Threat (APT) detection, and more.

➤ Training

Siege International offers training in multiple presentation formats and diverse content. Our training consultants will customize a course that meets your needs and objectives.

➤ Cyber Alliance Program

More than a single point in time assessment, the Cyber Alliance Program (CAP) is an ongoing partnership with a team of expert information security consultants.

Penetration Testing

Defend your Data

Siege International's penetration testing services identify exploitable vulnerabilities that allow unauthorized access to systems and data. Our certified expert consultants expose serious weaknesses in almost every engagement performed. Using real world hacking techniques, our consultants safely identify critical vulnerabilities and quantify risk by demonstrating the level of access a dedicated adversary could obtain.

➤ Network Penetration Testing

Our network penetration testing service identifies exploitable vulnerabilities that allow unauthorized access to sensitive data or to your organization's network.

➤ Wireless Penetration Testing

Testing against the configuration and hardening of wireless access points in place at your facility to determine if an attacker could obtain wireless network access.

➤ Web Application Penetration Testing

With a focus on the OWASP Top 10, web application penetration testing uses non-disruptive techniques to identify weaknesses in your application code and database layers which could be exploited during an attack.

➤ Social Engineering

Tests employee susceptibility to various attacks such as email phishing, fraudulent phone calls, and unauthorized facility access. Assesses technical security controls' ability to detect and prevent social engineering attacks.

➤ Red Team

Combines all of the above services into a comprehensive attack against your company. This is a true test of the maturity of your information security program and your ability to detect and respond to attacks.
